BUILD A PYTHON CODE ,ASSUME U  
GET TEMPERATURE AND  
HUMIDITY VALUE AND WRITE A  
CONDITION TO CONTINUOUSLY  
DETECT ALARM IN CASE OF HIGH  
TEMPERATURE:

This article ,we shall  
discuss interacting DHT11 with  
Respectlly Pi and see it working using  
python code .Also ,we shall display real-  
time data on the 16x2 LCD will be  
included with its article home page. So  
lets begin.

- ❖ You may visit its [Arduino Tutorial](#) to have a more clear Idea of Its working if you are working so , here we are giving you the tutorial on how to connect dht11 with Raspberry Pi.
- ❖ DHT11 is a simple sensor and has a very simple structure for measuring temperature and humidity. Basically, it is an enclosed structure that consists of two wires which are responsible for checking humidity and temperature.

## DHT11 with Raspberry Pi Diagram

**DHT11 with Raspberry pi Circuit Diagram**

Import Adafruit\_DHT

DHT11=Adafruit\_DHT.DHT11#Adafruit\_DHT.DHT22 for DHT22 sensor.  
While True:

Try:

```
Temp,humid=Adafruit  
_DHT.read_retry(DHT11,4)#4 is the  
GPIO number you can change this to  
you required need.
```

```
Print("TEMP={0:0.1f} C  
HUMIDITY    ={1:0.1f} %"    format  
(temp,humid))
```

Except KeyboardInterrupt:

Break

- ❖ The first line as we have said we have imported the library for the DHT11 Sensor to work i.e., Adafruit\_DHT. You can use this

library with DHT22 also , but you need to change the DHT11 object line.

- ❖ Then we create a DHT object which store the DHT11 sensor configuration details and further in code we use this object name to refer to all working statements.
- ❖ Next we create an infinite while loop within Try and expect method to create a keyboard interrupt terminating condition ie.,Ctrl+C
- ❖ In next line we read data from the DHT11 Sensor and stores it in two variable values are begin received ,one for temperature and other for humidity.

**CODING:**

```
#!/usr/bin/python
```

```
Import struct,array,time,io,fcntl
```

# I2C\_SLAVE=OX0703

```
# find with  sudo i2cdetect -y 1
HDC1008_ADDR = 0x40

bus=1

fr = io.open("/dev/i2c-
"+str(bus), "rb", buffering=0)
fw = io.open("/dev/i2c-
"+str(bus), "wb", buffering=0)

# set device address
fcntl.ioctl(fr, I2C_SLAVE,
HDC1008_ADDR)
fcntl.ioctl(fw, I2C_SLAVE,
HDC1008_ADDR)

time.sleep(0.015) #15ms startup
time

s = [0x02,0x02,0x00]
```

```
s2 = bytearray( s )  
fw.write( s2 ) #sending config  
register bytes  
time.sleep(0.015)  
# From the data sheet
```

```
s = [0x00] # temp  
s2 = bytearray( s )  
fw.write( s2 )  
time.sleep(0.0625)  
# From the data sheet
```

```
data = fr.read(2) #read 2 byte  
temperature data  
buf = array.array('B', data)  
print ( "Temp: %f" % (  
(((buf[0]<<8) +  
(buf[1]))/65536.0)*165.0 ) -  
40.0 ) )
```

```
time.sleep(0.015)
# From the data sheet
```

```
s = [0x01] # hum
s2 = bytearray( s )
fw.write( s2 )
time.sleep(0.0625)
# From the data sheet
```

```
data = fr.read(2) #read 2 byte
temperature data
buf = array.array('B', data)
print ( "Humidity: %f" % (
(((buf[0]<<8) +
(buf[1]))/65536.0)*100.0 ) ) )
```
